OpenClaw on Dedalus completed one replay step. PM package delivered.
Thesis-break audit logged.

PROBLEM

Equity research is not one task.

The real work is a chain of decisions across research, PM, risk, desk, and monitoring. Most AI tools stop at narrative.

The gap is not 'can an LLM write a memo?' It is whether an AI system can preserve context, create artifacts, pass gates, manage a paper position, and explain every decision.

One Thesis Record powers the desk.

Sources converge into a single stateful object. Everything else is a view, artifact, decision, or action derived from it.

Human-guided thesis workbench.

The analyst drives the idea. Citadail generates the package, routes decisions, and keeps artifacts tied to the same thesis.

PAPER DESK

Entry 118.20
Current 123.70
P&L +4.7%
Action Hold

A walk-forward paper investment firm.

The system advances through historical time, sees only what was known then, and continuously opens, manages, and exits paper positions.

The run is measurable.

Full Auto produces a paper book, open positions, an equity curve, and a decision journal.

A product shell with real execution paths.

The judges should see the stack: Next.js workbench, server APIs, Full Auto runtime, Spectrum/iMessage, and Dedalus/OpenClaw proof.

INTERFACE	Landing, tabbed workbench, Full Auto control room, sidebar chat
SERVER APIS	Generation, Office export, Full Auto step, runtime status, market brief
CORE STATE	Session, EquityProject, ThesisRecord, PaperPosition, Journal
AGENT RUNTIME	Morning Brief -> Analyst Swarm -> PM -> Validation -> Risk -> Desk -> Monitor
AMBIENT LAYER	Spectrum TypeScript agent for iMessage and terminal
MACHINE PROOF	Dedalus runtime adapter with OpenClaw step proof and local fallback

- Next.js
- Gemini
- Office files
- Spectrum
- Dedalus
- OpenClaw
- Historical replay

The desk also lives in iMessage.

Spectrum turns Citadail into a PM group-chat participant, not just a web app.

TRIGGER RULES	Group chats require Citadail or cd prefix
ATTACHMENTS	Memo, model, and deck can be sent from the same project data
NEWS	Ticker-specific replay/source responses
RUNTIME	PM can ask if Dedalus/OpenClaw is healthy

Machine-backed when available. Safe when not.

Dedalus and OpenClaw are used where they matter: executing a bounded replay step, persisting proof, and falling back cleanly.

- 1 UI sends one bounded step
- 2 Runtime wrapper tries Dedalus/OpenClaw
- 3 Remote output shape is validated
- 4 Proof is persisted and surfaced
- 5 Hybrid falls back locally if needed

PROOF OBJECT

**OpenClaw on Dedalus completed one replay step at
Apr 21, 2022 with 28 agent events.**

remote_success
execution id
latest 3 proofs

No arbitrary browser shell. No secrets to client. Paper-only state sync.

WHY THIS WINS

It is not a prompt demo. It is a working desk.

Citadail scores because the agent creates durable work, coordinates with humans, and leaves an auditable trail.

DEPTH OF ACTION

Generates thesis, artifacts, PM review, risk gate, paper trade, monitor, and journal.

CONTEXT QUALITY

Every replay step is time-bounded and source-filtered by simulation time.

HYBRID INTELLIGENCE

Assist Mode keeps the human in charge; Full Auto shows the system running the loop.

SPONSOR FIT

Spectrum for iMessage, OpenClaw-style agent runtime, Dedalus machine proof.

DEMO CLARITY

Four visible proof signals: OpenClaw execution, PM delivery, iMessage response, thesis-break audit.

A PM can use it Monday: ask for the book, inspect a thesis, download the package, and see why every paper decision happened.
